Known limitation

First level folders or other container objects in your content structure can't have the same name as the existing siteaccesses if you configured your site to use URL access method. Considering an existing "ezflow_site" siteaccess exists, if you create a folder with the same name and try to access it using `http://<your_site>/ezflow_site` you will be redirected to the siteaccess instead on accessing your "ezflow_site" folder. This is actually a known limitation of the URI siteaccess matching.

If you need to use first level folders or other container objects with the same name as any of your siteaccesses we suggest you to use hostname matching instead.

For more details on configuring hostname matching, please check the [Siteaccess Matching](#) documentation.
