

# ez\_field\_value

- [Description](#)
- [Prototype and Arguments](#)
- [Usage](#)

## Description

`ez_field_value()` is a Twig helper which returns a Content item's field value in the current language.

This can be useful when you don't want to use [ez\\_render\\_field](#) and manage the rendering by yourself.

If the current language cannot be found as a translation for content, the main language will be used. This behavior is identical when forcing a language using **forcedLanguage**.

## Prototype and Arguments

```
ez_field_value( eZ\Publish\Core\Repository\Values\Content\Content content, string fieldDefIdentifier [, string forcedLanguage] )
```

| Argument name      | Type  | Description  |
|--------------------|---|--|
| content            | eZ\Publish\Core\Repository\Values\Content\Content | Content object the field referred to with <b>fieldDefIdentifier</b> belongs to.                        |
| fieldDefIdentifier | string  | Identifier of the field we want to get the value from.   |
| forcedLanguage     | string  | Locale we want the content name translation in (e.g. "fre-FR"). Null by default (takes current locale) |

## Usage

```
<h2>My title value: {{ ez_field_value( content, "title" ) }}</h2>
```
