

What is eZ Platform?

eZ Platform is an open-source, Symfony-based CMS. With its modern architecture and flexibility it lets you customize, extend and scale your sites and apps with ease. It is built on top of the Symfony full-stack framework and enables you to tailor your content model and distribute your content however you like.

Take control of your content:

Seamlessly deliver content on your site or app and use our fully featured REST API to integrate content from apps or deliver Content as a Service.

Take advantage of Symfony, the leading PHP framework:

Develop in a very similar way to pure Symfony, with the same templating system, Twig, the same library for deployment and version dependency, Composer, and many other Symfony bundles and components.

Speed up time-to-market:

Developers who use Symfony can start customizing and extending eZ Platform right out of the gate. New to Symfony? You have plenty to gain.

Start with clean code:

eZ carries a substantially low level of technical debt compared to many other CMSs.
