

Events

Introduction

This page presents the events that are triggered by eZ Publish 5.

eZ Publish Core

Event name	Triggered when...	Usage
<code>ezpublish.siteaccess</code>	After the SiteAccess matching has occurred.	<p>Gives further control on the matched SiteAccess.</p> <p>The event listener method receives an <code>eZ\Publish\MVC\Event\PostSiteAccessMatchEvent</code> object.</p>
<code>ezpublish.pre_content_view</code>	Right before a view is rendered for a content, via the content view controller.	<p>This event is triggered by the view manager and allows you to inject additional parameters to the content view template. The event listener method receives an <code>eZ\Publish\MVC\Event\PreContentViewEvent</code> object.</p>
<code>ezpublish.api.contentException</code>	The API throws an exception that could not be caught internally (missing field type, internal error...).	<p>This event allows further programmatic handling (like rendering a custom view) for the exception thrown.</p> <p>The event listener method receives an <code>eZ\Publish\MVC\Event\APIContentExceptionEvent</code> object.</p>

eZ Publish Legacy

Event name	Triggered when...	Usage
<code>ezpublish_legacy.build_kernel_web_handler</code>	Right before the build of the legacy kernel web handler.	<p>This event allows to inject parameters into the web handler (mainly for internal use)</p> <p>The event listener method receives an <code>eZ\Publish\Legacy\Event\PreBuildKernelWebHandlerEvent</code></p>
