 - Provided View\Provider implementations
- Custom View\Provider
 - Difference between View\Provider\Location and View\Provider\Content
 - When to develop a custom View\Provider\Location\Content
 - Example

View\Manager & View\Provider

The role of the (`eZ\Publish\Core\MVC\Symfony\`)View\Manager is to select the right template for displaying a given content or location. It aggregates objects called *content and location view providers* which respectively implement `eZ\Publish\Core\MVC\Symfony\View\Provider\Content` and `eZ\Publish\Core\MVC\Symfony\View\Provider\Location` interfaces.

Each time a content is to be displayed through the Content\ViewController, the View\Manager iterates over the registered content or location View\Provider objects and calls `getView()`.

Provided View\Provider implementations

Name	Usage
<code>View provider configuration</code>	Based on application configuration. Formerly known as <i>Template override system</i> .
<code>eZ\Publish\Core\MVC\Legacy\View\Provider\Content</code> <code>eZ\Publish\Core\MVC\Legacy\View\Provider\Location</code>	Forwards view selection to the legacy kernel by running the old content/view module. Pagelayout used is the one configured in <code>ezpublish_legacy.<scope>.view_default_layout</code> . For more details about the <code><scope></code> please refer to the scope configuration documentation.

Custom View\Provider

Difference between View\Provider\Location and View\Provider\Content

- A View\Provider\Location only deals with Location objects and implements `eZ\Publish\Core\MVC\Symfony\View\Provider\Location` interface.
- A View\Provider\Content only deals with ContentInfo objects and implements `eZ\Publish\Core\MVC\Symfony\View\Provider\Content` interface.

When to develop a custom View\Provider\Location\Content

- You want a custom template selection based on a very specific state of your application
- You depend on external resources for view selection
- You want to override the default one (based on configuration) for some reason

View\Provider objects need to be properly registered in the service container with the `ezpublish.location_view_provider` or `ezpublish.content_view_provider` service tag.

```
parameters:
  acme.location_view_provider.class: Acme\DemoBundle\Content\MyLocationViewProvider

services:
  acme.location_view_provider:
    class: %ezdemo.location_view_provider.class%
    tags:
      - {name: ezpublish.location_view_provider, priority: 30}
```

Tag attribute name	Usage
priority	<p>An integer giving the priority to the View\Provider\(Content Location) in the View\Manager.</p> <p>The priority range is from -255 to 255</p>

Example

Custom View\Provider\Location

```
<?php

namespace Acme\DemoBundle\Content;

use eZ\Publish\Core\MVC\Symfony\View\ContentView;
use eZ\Publish\Core\MVC\Symfony\View\Provider\Location as LocationViewProvider;
use eZ\Publish\API\Repository\Values\Content\Location;

class MyLocationViewProvider implements LocationViewProvider
{
    /**
     * Returns a ContentView object corresponding to $location, or void if not
     applicable
     *
     * @param \eZ\Publish\API\Repository\Values\Content\Location $location
     * @param string $viewType
     * @return \eZ\Publish\Core\MVC\Symfony\View\ContentView|null
     */
    public function getView( Location $location, $viewType )
    {
        // Let's check location Id
        switch ( $location->id )
        {
            // Special template for home page, passing "foo" variable to the template
            case 2:
                return new ContentView( "AcmeDemoBundle:$viewType:home.html.twig",
array( 'foo' => 'bar' ) );
            }

            // ContentType identifier (formerly "class identifier")
            switch ( $contentInfo->contentType->identifier )
            {
                // For view full, it will load AcmeDemoBundle:full:small_folder.html.twig
                case 'folder':
                    return new ContentView(
"AcmeDemoBundle:$viewType:small_folder.html.twig" );
                }
            }
        }
    }
}
```
