  - [Getting the translated name for a Content item](#)
  - [Forcing a specific language](#)

## Description

`ez_content_name()` is a Twig helper which allows displaying a Content item's name in the current language.

If the current language cannot be found as a translation for content, the name in the main language is always returned. This behavior is identical when forcing a language.

## Prototype and Arguments

```
ez_content_name( eZ\Publish\Core\Repository\Values\Content\Content content[, string forcedLanguage] )  
ez_content_name(ContentInfo[, string forcedLanguage] )
```

Argument name	Type	Description
content	eZ\Publish\Core\Repository\Values\Content\Content or eZ\Publish\Core\Repository\Values\Content\ContentInfo	Content or ContentInfo object the displayable field belongs to.
forcedLanguage	string	Locale we want the content name translation in (e.g. "fre-FR"). Null by default (takes current locale)

## Usage

```
<h2>Content name in current language: {{ ez_content_name( content ) }}</h2>  
<h2>Content name in current language, from ContentInfo: {{ ez_content_name(  
content.contentInfo ) }}</h2>  
<h2>Content name in french (forced): {{ ez_content_name( content, "fre-FR" ) }}</h2>
```

## Equivalent PHP code

### Getting the translated name for a Content item

```
// Assuming we're in a controller action

```

## Forcing a specific language

```
// Assuming we're in a controller action
$translatedContentName = $this->get( 'ezpublish.translation_helper'
)->getTranslatedName( $content, 'fre-FR' );
```
