

The cloud administration interface

The eZ Publish Cloud Service provides an easy to use web interface for administrators to manage environments and deployments. It can be accessed via <https://admin.cloud.ez.no>. More information about the concepts behind the eZ Publish Cloud Service you can find [here](#).

The interface has three mayor views: Administration area, User management view and Environment view

Administration Area (Dashboard) View

The Administration Area is the entry point after you logged in. It provides you an overview of all Environments you have access to.

A click on one of the Environments in the list exposes some details of the selected environment.

The screenshot shows the eZ Publish Cloud Administration Area (Dashboard) View. The header includes the eZ Publish Cloud logo and the text "(beta)" in large font, with "Administration Area for your Environments" in smaller red text below it. In the top right corner, there are "Help" and "Logout" buttons. The main content area displays a list of environments. The first environment, "ezTest - Demo Environment 1", is expanded to show details. This details view includes the text "eZ Publish Cloud BASIC edition" and a "Show Details" link. Below this, there is a table with two columns: "Domain:" and "Domain Alias:". The "Domain:" column lists "9.pub.ez.cloud.ixonos.com". The "Domain Alias:" column lists five aliases: "ezp47-www.cloud.ez.no", "ezp47-ger.cloud.ez.no", "ezp47-fre.cloud.ez.no", "ezp47-eng.cloud.ez.no", and "ezp47-eng.cloud.ez.no". To the right of this table is an "Edit" button with a pencil icon. Below the expanded environment, there is a section for "ezTest - Playground".

Domain:	Domain Alias:
9.pub.ez.cloud.ixonos.com	ezp47-www.cloud.ez.no
	ezp47-ger.cloud.ez.no
	ezp47-fre.cloud.ez.no
	ezp47-eng.cloud.ez.no
	ezp47-eng.cloud.ez.no

The details contain information according the underlying service subscription and the current deployment in the live stage. The site accesses of the live deployment and their related domains are listed. This site accesses are the public entry points to your installations, if you configured your DNS properly. Each environment has a unique domain associated with it. This domain must be used for the CNAME Resource Records in your DNS for all the site accesses you specify in your eZ Publish configuration.

Hide Details

Hotline availability:

none

Max Number of content objects:

1000

Editorial seats included:

1

Your deployments in Staging and Rollback are protected. To access them use the following credentials:

Username:

Password:

To upload changes to the cloud, please use the following credentials. Remember, you have to provide a ssh key to be able to login.

Git repository:

@git.ez.cloud.ixonos.com:ez.git

Sftp:

@ftp.ez.cloud.ixonos.com:22

Domain:

9.pub.ez.cloud.ixonos.com

Domain Alias:

ezp47-www.cloud.ez.no

ezp47-ger.cloud.ez.no

ezp47-fre.cloud.ez.no

ezp47-eng.cloud.ez.no

ezp47-eng.cloud.ez.no

Edit

The "show details" link in the environment overview exposes further information like the login and password to access deployments, which are not in the live state. These credentials apply to all deployments in staging and rollback. Also the credentials for the git repository of the environment and the sftp account are provided here. These accounts are ssh protected and just accessible if the user has provided a valid ssh-key.

To access the actual environment click on the "Edit" button.

If you are an administrator for the environment, you will also find a "Manage Users" button, which leads you to the user management view.

User Management View

If you have administrator rights for an environment, you can access the User Management View. Click on the "Manage Users" button in the details area of an environment.

The user management page lists all users, who have access to the selected environment. The "SSH Key Name" column provides you information whether the user has uploaded a ssh key and therefore access to sftp and git. You can assign and revoke new rights to existing or new users and also remove them entirely from the environment. You cannot edit your own permissions.

ezTest - Playground

User Name	SSH Key Name	Admin	
 @gmail.com	Loaded from ez.no	<input checked="" type="checkbox"/>	<button>remove</button>
 @ez.no	No SSH Key available	<input checked="" type="checkbox"/>	<button>remove</button>
 @ez.no	Work2		

Current User can't edit his permissions

Add User

None of your changes have been saved. To save the changes you made, click on the "Save Changes" button.

Discard Changes

Save Changes

To give a new user access to an environment click the "Add User" Button. The user has to be already registered as a eZ community user (<https://login.ez.no>) If the designated user has no account yet, please ask the user to register at login.ez.no to create a new account. You can not precede until the user was created in our system. To grant access, please enter the username (as it was set on account creation for the community account). If the user is found in the users pool, it will appear in the list of users of the environment.

Add user to environment

Please enter the login name of the user, you want to add to the environment. (The user has to be an already registered user of eZ.)

User Login:

Cancel 

Confirm 

Important

All changes to the users of an environment are first collected in the browser and propagated to the server if you click the "Save Changes". If you leave the user management page without explicit saving, none of your changes will be preserved.

Environment View

To access the environment view click on the edit button of the desired environment.

The environment page is separated in two areas. The upper area shows the three stages of the environment with links to the according deployments.

Your current staging deployment

LIVE i

vtest

Your current live deployment

ROLLBACK i

STAGING and what it means:

The deployment under "Staging" is in a state before going live.

The customer can call the website via canonical url, but the website is not accessible from the public internet. Note: There can be only one staging deployment. A new one can only be created after deleting the current or putting the current live.

LIVE and what it means:

In the live state there is the deployment which is currently accessible on the internet.

This deployment can also be maintained for example by using the file import. Once a staging deployment is forwarded to live, the current live deployment is placed in the rollback area.

ROLLBACK and what it means:

Rollback deployment are each available for at least 24 hours.

If the current live deployment has some errors or is not satisfying, the customer has the possibility to rollback to an older version within 24 hours. On rollback the selected deployment is placed into the live area and the current live deployment is placed into the rollback area.

If you click on one of the deployment links the details of the deployment are revealed in the lower area. The details view of a deployment shows the current site access configuration and provides links to the site accesses. It also provides you the current status of the deployment.

InfoContent ExportStatus

vtest

Here you find all information of your deployment.

Used GIT Tag: originalVersion
Used database dump: ezp47-dump.sql
Used content tarball: ezp47-var.tar.gz
Web Site Accesses : fre (http://ezp47-fre.cloud.ez.no)
ger (http://ezp47-ger.cloud.ez.no)
eng (http://ezp47-eng.cloud.ez.no)
ezdemo_site_user (http://ezp47-www.cloud.ez.no)
Editor Site Accesses: ezdemo_site_admin - ezp47-admin.cloud.ez.no

Delete

Further you can create an Export of the Deployment, which provides you a database dump and a tar.gz file with the contents of the var-folder (where your Images and binary data is located). The export files can also be used to create a new deployment or to setup a local development environment with the content of the live installation in the eZ Publish Cloud. The export files can be found at the sftp server.

Info**Content Export**Status

vtest

Here you can start a new export of the content (database and content folder) of the deployment. After the export has finished you find the files on the sftp of the environment.

You have no data export available for this deployment.

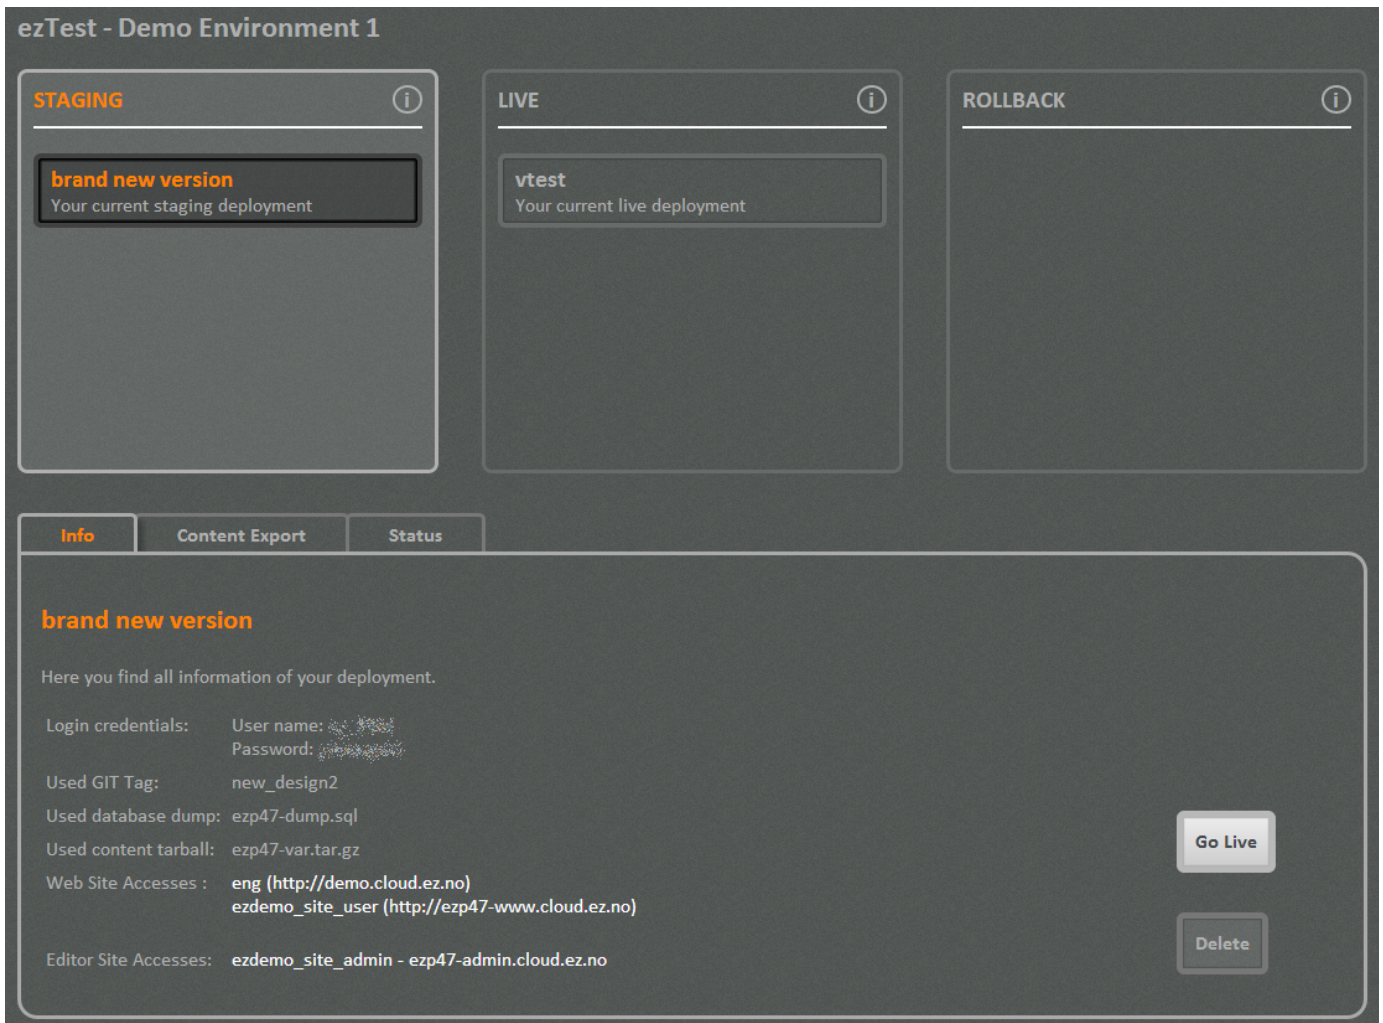

Start New Content Export

Delete

The status tab provides you the current status of the deployment.

If you open a deployment in staging you will have the "Go Live" button available, which will move the deployment to the live stage and make it available for your customers, while the current deployment in live will be pushed to rollback. For deployments in staging or rollback the site accesses are protected with basic http authentication. The user name and password is available on the info tab of the deployment.

Create New Deployment

If you have no deployment in the staging stage a "New Deployment" button is shown, which offers you the possibility to create a new deployment.

To create a new Deployment, click on the "New Deployment" button in the Staging stage.

A dialog appears below the Stages. Follow the given process to create a new deployment.

Step 1:

1. Enter a name for the new Deployment
2. Select the git tag for the source which should be used for the deployment

3. Click "Next"

Step 2:

1. Select the eZ Publish version you have build your website on
 - Select the major version of eZ Publish
 - Select the Service Package Level
 - Decide whether you rely on the lagacy stack or use the new stack introduced in 5.0
2. Decide if you want to get your deployment auto updated with updates for critical errors and security issues.
(the auto update checkbox has no function yet, you can ignore it for now. In the future it indicates whether or not you want an automatic deployment of updates for critical errors and security issues.)
3. Click "Next"

Step 3:

1. Decide if you want to use the database and content of the current deployment in the Live Stage (only available if you already have a live deployment)
2. In case, select the *matching* db-dump and the content tar which you have uploaded before
3. Click "Next"

Step 4:

1. Review your configuration and initialize the Deployment.
2. You will be asked to enter a comment for the new Deployment.
3. Confirm and the deployment process is triggered on our data center.

The new Deployment will appear in the staging stage and indicate, that it is not ready yet. Once the deployment process has finished, the status of the deployment will change.
