ez_urlalias

Description

`ez_urlalias()` is a Twig helper for generating URLs for a location, from the given parameters.

Prototype and Arguments

`ez_urlalias(` eZ\Publish\API\Repository\Values\Content\Location name[, array parameters][, bool absolute] `)`

Argument name	Type	Description
name	string | \eZ\Publish\API\Repository\Values\Content\Location	The name of the route or a Location instance
parameters	array	An array of parameters
absolute	boolean	Whether to generate an absolute URL

Working with Location

Linking to other locations is fairly easy and is done with native `path()` Twig helper (or `url()` if you want to generate absolute URLs). You just have to pass it the Location object and `path()` will generate the URLAlias for you.

```
{# Assuming "location" variable is a valid
eZ\Publish\API\Repository\Values\Content\Location object #}
<a href="{{ path( location ) }}">Some link to a location</a>
```

I don't have the Location object

If you don't have the Location object, but only its ID, you can generate the URLAlias the following way:

```
<a href="{{ path( "ez_urlalias", {"locationId": 123} ) }}">Some link to a location,
with its Id only</a>
```

The parameter for the second path() argument is the locationId for URLAlias.

Error management

For Location alias setup 301 redirect to Location's current URL when:

1. alias is history
2. alias is custom with forward flag true
3. requested URL is not case-sensitive equal with the one loaded

> **ⓘ Under the hood**
>
> In the backend, `path()` uses the Router to generate links.

This makes also easy to generate links from PHP, via the `router` service.
